Final project

For this project I had to search and watch YouTube videos on how to import Json using Gson. I had to look up several examples and asked Gemini to show me some generic examples of using Gson. I had to also search the libraries to import to properly use Gson. I also had to search for the files to download and where to put them in my project. I also referenced the book, past projects, and the internet to look find some examples of things we've done throughout the semester like string to time stamp and Javadoc comments. Working with Gson was new in this project and seems very important so I am glad to have some experience with that and an example to go back and look over. I certainly plan on doing some more research and self-assigned projects to learn more. Another thing I learned was the importance of comments in a longer time-consuming project. I had to reference back to code that I had written several days prior and had to spend time recalling what I had done. Better comments while I was writing the early stages would have helped a lot and saved time later.

This class added to my Java toolbelt and was very helpful. I learned a lot more about Java and coding than in my first semester of Java. With the completion of this class I will receive my Fast Track Programming certificate. I plan on continuing to complete my associate's degree in software development but hope to use this certificate to break into the industry and begin my career change. Thank you for your help throughout the semester.
